特别提示：本代码为所有顶点的数据类型由整型改为双精度后代码，这样可避免因类型转换引起精度损失。其中被替代的代码仍保留，但已被注释掉。
功能：节点细化。对包括均匀、准均匀、分段贝齐尔、一般非均匀和包绕型B样条闭曲线的节点矢量批量插入节点。
输入参数：m_manyR为重复插入相异节点的次数序列；
m_manyM为插入节点序列在原节点矢量中已有的重复度序列；
m_manyU为插入递增的相异节点序列；
未列入形参的控制顶点(m_xnewVertex,m_ynewVertex)、节点矢量m_newNode、次数m_nTimes，均为被保护成员。
输出参数：p、q分别为插入的相异节点序列在原节点矢量中左右端节点下标；插入节点序列后生成的新控制顶点(含未改变的原顶点) (m_xnewVertex,m_ynewVertex)
与节点矢量m_newNode均为被保护成员。InsertTimes-总的插入次数，即增加控制顶点数，公有成员。
调用函数： GetKnotsRepeats为获得顶点数为n+1的k次B样条曲线的节点矢量TemNode中的相异节点数组Knots与重复度数组(两者均为公有成员)。

```
void InsertManyU(CArray<int,int> &m_manyR,CArray<int,int> &m_manyM,CArray<double,double> &m_manyU,int
&p,int &q)
{
	int j,pj,ii,jj;
	int k=m_nTimes;
//获得要被插入的节点区间左端节点下标值
	for(ii=0;ii<m_newNode.GetSize();ii++)
		if(m_manyU[0]<m_newNode[ii]) {p=ii-1;   break;}
//获得要被插入的节点区间右端节点下标值
	for(ii=0;ii<m_newNode.GetSize();ii++)
		if(m_manyU[m_manyU.GetSize()-1]<m_newNode[ii]) {q=ii;   break;}
//确定总的插入次数，即增加的顶点数InsertTimes
	for(ii=0;ii<m_manyU.GetSize();ii++)
	{
		int Rii=m_manyR[ii];
		InsertTimes=InsertTimes+Rii;
	}
//确定节点矢量m_newNode中的相异节点数组Knots与重复度数组Repeats及其长度l。
//	int n=m_newVertex.GetSize()-1;
	int n=m_xnewVertex.GetSize()-1;
